

OrbitPredict

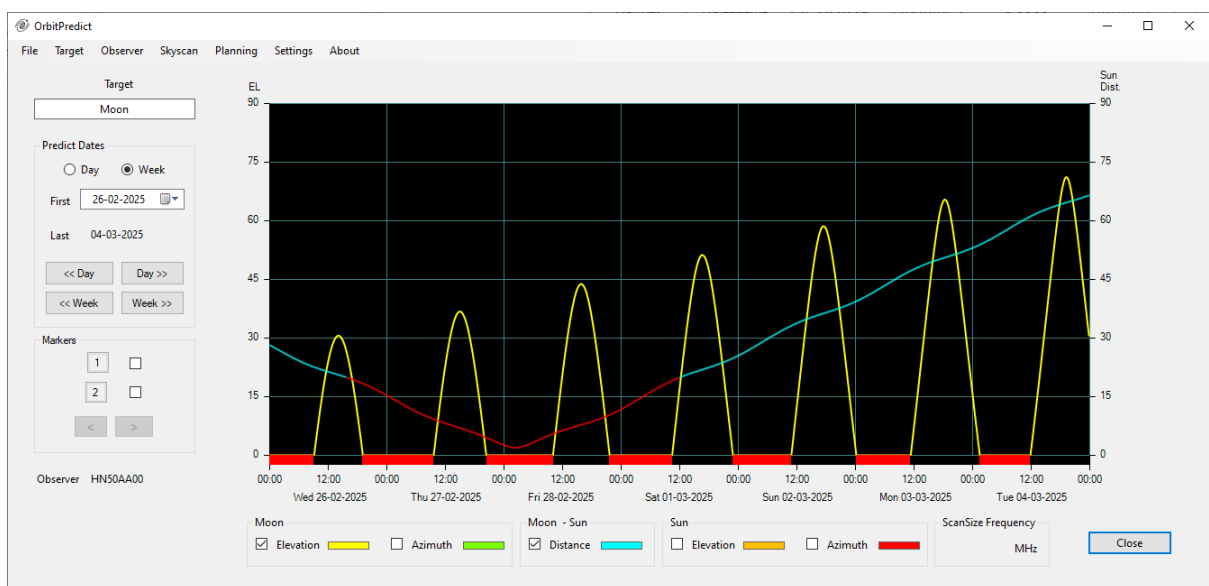

Installation

Copy the folder with the contents after unpacking to a location on the PC where you have the rights to make changes e.g. Downloads or Documents

When updating, simply copy the files from the new version of OrbitPredict to the location of the old version, thus replacing the old version with the new one.

When OrbitPredict is started for the first time, it may be asked for Microsoft Windows Desktop Runtime.

When this is installed, the application will start with the screen below.

A configuration file (OrbitPredict.cfg) and a Data, Image and Planning folder were created with default values.

For Target this is the moon and for Observer a fictitious user with QTH HN50AA00 at Latitude +40 degrees and Longitude -30 degrees. (in the middle of the ocean 😊)

SkyScanner files are not included and that is why the bottom bar is red when the moon is below and black when the moon is above the horizon. This is to indicate that there is no Skyscanner data for those elevations.
